

1 Onboarding Screen

Onboarding Flow

Task Overview

The Onboarding screen is the first point of interaction for the user. Its primary purpose is to introduce the app's core features (Quran reading, Tasbeeh/Dhikr, and Radio) in an engaging, visual way, guiding the user through the value proposition of the "Islami" application.

Key Features & Logic

- Responsive UI: Designed to look consistent across different screen sizes.
- Navigation Logic:
 - 'Next' Button: Moves to the next index in the PageView.
 - 'Back' Button: Returns to the previous index.
 - 'Finish' Button: Appears only on the last page to navigate the user to the Main Screen/Home Screen.
- Asset Management: Custom assets (Images/Icons) are used for each slide to maintain the aesthetic theme.

Technical Implementation

- **Widget Used:** PageView (This is the standard Flutter widget for creating swipeable screens).
- **Controller:** PageController is used to manage the transition between pages and track the current index.
- **Indicators:** Used SmoothPageIndicator (or custom dots) to visually represent the current slide position and total number of pages.

Screens Breakdown

The onboarding flow consists of 5 slides:

- Splash/Welcome: Branding and application logo introduction.
- Community Welcome: Welcoming the user to the Islami community.
- Reading the Quran: Highlights the Quranic reading feature with an illustrative image.
- Bearish (Dhikr): Introduces the Tasbeeh/Dhikr feature to help users track their prayers.
- Holy Quran Radio: Introduces the audio feature for listening to the Holy Quran.

Task Overview

The Sebha screen provides an interactive digital rosary experience. It allows users to track their daily Dhikr with engaging visual feedback, simulating the physical movement of a real Sebha.

Core Logic & Requirements

- This screen relies on specific interaction rules to enhance the user experience:
- **Interactive Counter & Rotation:** With every tap on the Sebha area, the counter increments by 1, and the Sebha body rotates slightly.
- **Fixed Header, Rotating Body:** The rotation animation is strictly applied to the circular "body" of the beads. The "header" (the top pointing part of the Sebha) remains completely static and fixed in its position.
- **Auto-Reset & Dhikr Transition:** When the counter reaches the target number (33):
- The counter resets automatically to 0.
- The displayed Dhikr text changes to the next phrase in the sequence (e.g., from "سبحان الله" to "الحمد لله" to "الله أكبر").

Technical Implementation

- **Widget Used:** PageView (This is the standard Flutter widget for creating swipeable screens).
- **Controller:** PageController is used to manage the transition between pages and track the current index.
- **Indicators:** Used SmoothPageIndicator (or custom dots) to visually represent the current slide position and total number of pages.
